PROFESSIONAL SUMMARY

I'm the engineer teams bring in when the system that "works fine" starts cracking under real use. I'm also who they call when the monolith everyone's afraid to touch needs to become something the business can actually grow on. I've spent 8+ years doing exactly that. Most recently, I've been federating product-catalog and identity events across STC's OSS/BSS systems at DNext. Before that, I turned a manual billing process at BILL.com into a fully automated, zero-loss delivery system. I also led the platform revamp at Global Rescue that Fast Company recognized as one of the most innovative products of 2024. I lead small teams, ship production systems that other teams end up depending on, and make sure the engineers around me are shipping better too.

CORE COMPETENCIES

- **Languages, Frameworks & Frontend:** Java 8/17/21, Spring Boot, Micronaut, React 19, Angular Micro-Frontends
- **Cloud, Containers & CI/CD:** AWS (Lambda, ECS/Fargate, RDS, S3, KMS), Docker, Kubernetes, Jenkins, CI/CD Automation
- **Data & Messaging:** Oracle, PostgreSQL, MySQL, DynamoDB, Kafka, RabbitMQ, SQS/SNS
- **Architecture & Security:** Event-Driven & Serverless Architecture, OAuth 2.0, OIDC/SAML, Keycloak
- **Testing, Observability & Practices:** JUnit 5, Mockito, TestContainers, Datadog, Splunk Cloud, Agile/Scrum, Kanban, Sprint Planning

PROFESSIONAL EXPERIENCE

Staff Software Consultant

Jul 2026 – Present

DNext — Client: STC (Saudi Telecommunications, BSS/OSS Federation)

Tech: Java, Spring Boot, Apache Kafka, Avro (Confluent Schema Registry), Camunda 7 (BPMN), Keycloak, Angular, PostgreSQL, MongoDB, Docker

- STC's BSS/OSS synchronization engine federates product-catalog changes from the master product catalogue out to downstream systems — CPQ (Configure, Price, Quote), ECOM (E-Commerce channel, via Ericsson Catalog Manager), and OCS (Online Charging System, Ericsson). It orchestrates the flow through Camunda BPMN workflows.
- Ramping into the engine's event-processing pipeline: contributed to sequencing of event-group processing, and added Avro-schema Kafka topic integration for user onboarding and role-assignment events, extending the existing publish/listener flow to carry identity and access-lifecycle events through the same federation pipeline.

Staff Consultant Engineer

Dec 2025 – Jul 2026

10Pearls — Client: BILL.com (US Fintech, AP/AR Automation)

Tech: Java 17+, Micronaut 4, Kafka, Flink, AWS (ECS/Fargate, RDS, S3, SQS/SNS, KMS), Angular/React 19, Docker, Datadog, Splunk Cloud

- Closed a gap where customers on BILL.com's Supplier Payments Plus were getting invoices but no email statements: designed and shipped an end-to-end notification pipeline using an async outbox + CDC + Kafka + Flink pattern, delivering automated PDF billing statements with zero-loss delivery and zero manual intervention.
- Owned the pipeline end to end — recipient lookup, template assembly, PDF generation, secure S3 upload — and established the data boundary between the Billing Engine and Billing Facade, resolving a recurring source of cross-team integration friction.

Senior Software Engineer & Team Lead

Mar 2022 – Nov 2025

Global Rescue LLC (US SaaS — Travel Risk & Crisis Management)

Tech: Java 21, Spring Boot 3, Node.js, AWS (ECS, Lambda, API Gateway, DynamoDB, S3, SQS, SNS, SES), MySQL, Redis, Elasticsearch, RabbitMQ, Keycloak, Datadog, TestContainers

- When I joined, Global Rescue was running on an aging monolith that couldn't keep up with the business. Over 3.5 years, I spearheaded the GRID 2.0 revamp that broke it into microservices. Customer renewals jumped after the beta, and Fast Company put Global Rescue on its Most Innovative Companies list in 2024 — recognition specifically tied to the system we rebuilt.
- Led a team of 6 engineers. My job wasn't just assigning tickets — it was setting architectural direction, running design reviews, mentoring mid-level engineers into senior roles, and being the bridge between US-based product leadership and our distributed engineering team.
- The company had three separate authentication flows that nobody fully understood. I consolidated them into a single

identity layer — OAuth 2.0 + OIDC via Keycloak with custom SSO support, API Gateway integration, and backward compatibility through dynamic proxies. One system instead of three.

- Built the internal platform libraries that other teams now depend on: an auth SDK, a circuit-breaker messaging layer, and a unified notification service for email, push, and SMS. It's the kind of quiet infrastructure that prevents outages and saves every team weeks of reinventing the wheel.
- Created a custom monitoring system for the company's most critical API (SOS emergency calls). If that endpoint goes down, lives are at risk. My integration-testing framework with synthetic monitoring caught regressions before they ever hit production.
- Defined the API contracts that let front-end teams (React and Angular) build in parallel with backend — cutting the integration phase from weeks to days.

Software Engineer

Mar 2021 – Mar 2022

Stella Technologies (US Digital Healthcare — Silicon Valley)

Tech: Java, Spring Boot, Node.js, AWS Lambda, Step Functions, S3, PostgreSQL, Sequelize ORM

- Stella had a healthcare platform that could talk to its own database but not to anyone else's. I engineered the HL7 & FHIR interoperability layer that opened it up to outside systems — unlocking data exchange partnerships that became a new revenue stream.
- Replaced a fragile cron-based data pipeline with serverless ETL on AWS Lambda and Step Functions. Data latency dropped from hours to near real time, and the on-call team stopped getting paged for pipeline failures.
- Introduced testing discipline where there was none: coverage gates, test-first culture, and a safety net that let us refactor aggressively without breaking things.

Software Engineer

Apr 2020 – Mar 2021

Zong — China Mobile Pakistan (Telecom)

Islamabad

Tech: Node.js, PostgreSQL, Sequelize ORM

- Took the AutoKiosk Machine from whiteboard to production for one of Pakistan's largest telecom providers. Owned planning, building, testing, and go-live.
- Shipped features for MyZong (millions of subscribers) while navigating tight sprints and cross-cultural collaboration with Chinese vendor teams.

Software Engineer

Jul 2018 – Mar 2020

Infinium Digital — TAJ Digital Healthcare

Islamabad

Tech: Java, Spring Boot, MySQL, AWS (EC2, RDS), Jenkins, OAuth, REST APIs

- Joined as a junior; left as the primary backend engineer. Built TAJ's digital healthcare platform from an MVP into a fully operational business within a year — the product that taught me what it means to own something end to end.
- Designed a referral engine that went viral on launch day: 10,000+ downloads in the first release, becoming the product's main growth channel before any paid marketing.
- Connected Total Care Saudi, insurance companies, pharmacies, and labs into a multi-tenant partner ecosystem for online medicine and lab ordering.

EDUCATION

Bachelor of Software Engineering — Bahria University, Islamabad

2014 – 2018

AWARDS, ENTREPRENEURSHIP & ADDITIONAL

- Winner, HEC Blockchain Hackathon 2018. 1st Place, Bahria University Open House 2018 (Engineering).
- Founded Pharmaconn (healthcare startup, won YES Competition).
- Co-founded Porter (\$20K pre-seed)
- English (Fluent), Urdu (Native)
